Step-by-Step Guide to Create the Report in MATLAB

1. Open MATLAB and create a new script file.
- Click on 'New Script'.
- Save the file with an appropriate name (e.g., main.m).

2. Define the Problem Parameters.
- Initialize all required variables.
- Assign constants and input values clearly at the beginning of the script.

3. Write the Core Computation Code.
- Implement formulas, equations, or algorithms step-by-step.
- Use comments (%) to explain each section.
- Example:

```
% Define variables
a = 5;
b = 10;
c = a + b;
```

4. Use Built-in Functions Where Necessary.
- For matrix operations: inv(), det(), eig(), etc.
- For plotting: plot(), xlabel(), ylabel(), title(), grid on.

5. Display Results Clearly.
- Use disp() or fprintf() to print outputs.
- Example:

```
fprintf('The result is: %.2f\n', c);
```

6. Generate Graphs (if required).
- Create figures using figure();
- Plot data using plot(x,y);
- Add labels and title for clarity.

7. Export Results to PDF from MATLAB.
- Option 1: Use 'Publish' feature:
a) Go to the Editor.
b) Click on 'Publish'.
c) Select output format as PDF.
- Option 2: Use MATLAB command:

```
publish('main.m','pdf');
```

8. Verify the Generated PDF.
- Check formatting, equations, and plots.
- Ensure all steps and outputs are clearly visible.

9. Final Submission.
- Rename the file as per submission guidelines.
- Ensure all figures and outputs are properly labeled.
